Exercise 2.3 (Small 3/2 points)

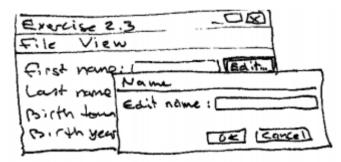

Design and build an interface for editing Person information:

- · first name
- · last name
- birth place
- · birth country

Person information should be visible in the main window but editable only via the dialogs opened by clicking buttons.

In Java program, use JOptionPane.showInputDialog for editing. In React/Material-UI, use <Dialog>

Enable navigation between persons either with menu items or buttons. Disable next/previous selection when in the first/last person.

Java application should generate a set of Person objects (you can decide how many) using Population class when it starts up. When instantiating a Population object, you can give any String, e.g., "Canada" as the country name parameter. In React application you can include an array of person info into your application.
